

# SRS Advantage Case Study:

## Using AWS Workspaces to Breathe Life into a Legacy Application

### **Challenge:**

When launching their business, SRS Advantage purchased an application previously developed for a similar business to serve as the foundation for their business operations. The difficulty was the application was created in the client-server model and SRS Advantage needed to work in a highly distributed fashion as their staff is located in various locations across the nation.

### **Solution:**

As an advanced AWS partner, Charter Solutions immediately saw an opportunity to leverage a combination of AWS EC2 instances and Workspaces as a means to accomplish the client need.

### **Outcomes:**

By staging the server portion of the application in an EC2 instance and implementing workspaces, we were able to effectively make the client-server application work in a distributed fashion, accomplishing the client goals with very little development and in record time. AWS workspaces was the ideal solution to adapt a non-distributed application to make it accessible from anywhere, require no capital investment, with high reliability and redundancy.

*“Charter Solutions is incredibly professional, honest, straightforward, productive and friendly. They take an interest in not only the project, but also the company and the individuals they are dealing with. Executive management gets involved in activities even with a small company such as ours. I cannot recommend them more highly.”*
